

## Financing Options for Energy Projects

#### Better Buildings by Design February 6, 2014

Peter Adamczyk Principal Consultant Efficiency Vermont

### **Session Description**

Familiarize yourself with the concepts of cash flow and energy projects: comparing projected energy savings with loan costs so you can assess—and share—a project's true economic value. We'll look at Vermont-specific case studies, examining the economics of several projects. We'll also review the financing options available throughout the state, discussing the pros and cons of each.

### Today's Agenda

- Definitions and concepts
- How Efficiency Vermont calculates energy savings
- Case studies
- Using energy savings in underwriting
- Case studies with financing options
- Overview of financing options
- Energy Efficiency Loan Guarantee Program
- Closing thoughts

### **Spend** to use up or pay out **Invest** to commit money in order to gain a

financial return; to devote for future advantage or benefit

### Energy investments differ from traditional investments

Return on investment (ROI) is money that is NOT spent on future energy bills. To determine the ROI, compare the actual energy cost with *what it would have been*; the difference is the ROI.

Frequently, the most expensive option is to do nothing. This concept of "opportunity cost" is key to assessing different financial options.

## Efficiency Vermont's credibility depends on accuracy in energy savings calculations.

Many customers rely on Efficiency Vermont as independent 3<sup>rd</sup> party for savings analysis when deciding about energy efficiency investments

• If we're not accurate, we risk jeopardizing future investments and our relationship with the customer

Efficiency Vermont savings claims are audited annually by Vermont's Public Service Dept.

• lowest realization rate has been 86.2%, average is 90.8%

#### Accurate analysis of electric bill and rate effects

## "Investing in energy efficiency" is not always core to business thinking

- "Growth" is a core business goal
- Energy costs are often considered fixed costs
- If business is growing, owners expect energy use (and costs) to increase, too.
- "Reducing energy *costs*" or "improving bottom line" is consistent with goal of growing business
  - Relate energy efficiency to revenue, profits, cashflow
  - "Reducing energy *use*" phrase conflicts with business core value of growth

# How do contractors and sales representatives estimate energy savings?

"Average" blended kilowatt hour costs or per gallon costs of oil, propane, etc.

"Rules of thumb" based on % saved – watch for 20%

Often verbal savings estimates

May rely on marketing "best case" scenarios for customer to extrapolate

Calibration to existing usage is rare

# How does Efficiency Vermont calculate energy savings?

We analyze cost savings projections using actual electric load shapes or fuel rate structure

- Demand rates
- Time of day rates
- "Ratchet" rates
- "High use"/"low use" fossil fuel categories

Evaluate if energy reduction will change customer's rate category Interactive effects, calibrate to actual usage

## Measuring for accurate analysis info

# Using information for accurate calculations

Many improvements involve straightforward engineering calculation of watts, hours, etc.

Measure use pre- and post-metering when power draw is larger, more variable/interactive or complex

• EVT analysis tools developed over last 11 years that reflect key inputs and field experience

EVT's Technical Resource Manual covers hundreds of energy saving measures

## Case Study: Variable speed drive on dust collection system

	F	Project Cashflow

## The fine print!

- 1. This cash flow analysis assumes no inflation.
- N umerical values projected in this analysis are estimates only. They are based on the professional judgment of Efficiency Vermont using information available about conditions prevailing when the analysis was performed. Efficiency Vermont makes no guarantee that these estimated outcomes will actually materialize.
- 3. Calculation of Internal Rate of Return (IRR) implicitly assumes that all interim cash flows are reinvested over the lifetime of the investment.
- 4. This cash flow analysis does not reflect tax consequences of the proposed investment. Consult your tax advisor for information on how this recommended project and financing method would affect your financial position for tax purposes.
- First year cost savings may be lower than projected if the customer is subject to electric utility demand charges with "ratchets" that set current billing demand based or demand recorded over the preceding twelve months.

# Case Study: Lighting for warehouse facility

## Underwriting considerations

Consider Efficiency Vermont incentive as component of down payment

- Based on projected energy savings
- 'Seal of approval' that project is cost effective

Compare to commercial real estate lending practices

- Difficulty of predicting future economics
- Debt coverage ratios
- Relies on extensive historical data

### Additional considerations

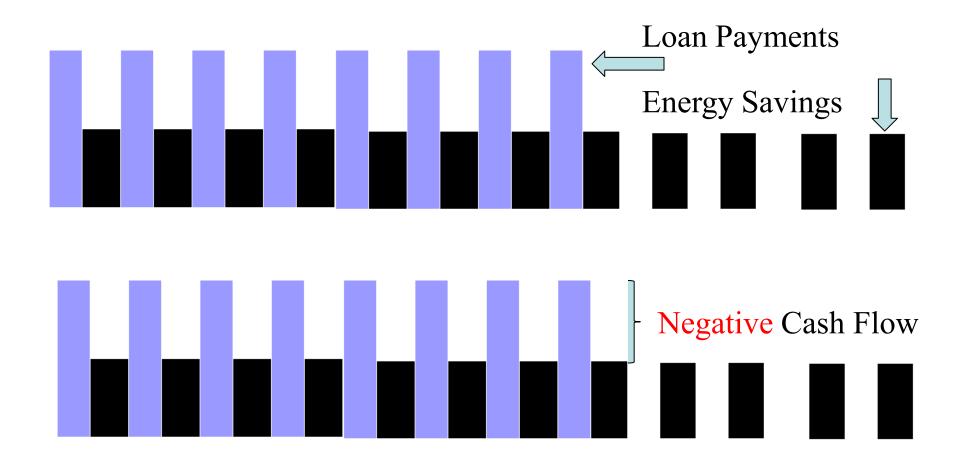

#### Effects of

- occupancy behavior
- Heating Degree Days/Cooling Degree Days (HDD/CDD)
- Fuel and electricity prices

Project cash flow is additive to customer cashflow and may be helpful at the margin

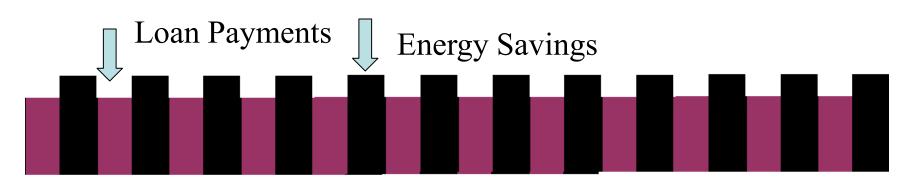

### The effect of loan term on cash flow

## Align the period of payment with the period of the savings

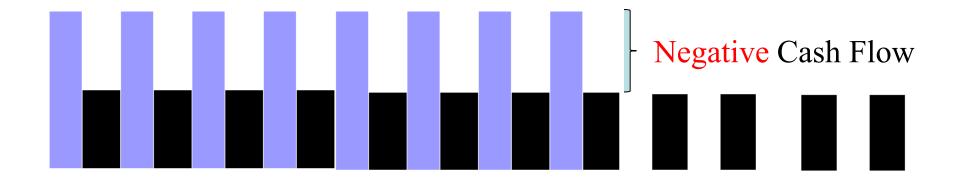

#### **Positive** Cash Flow

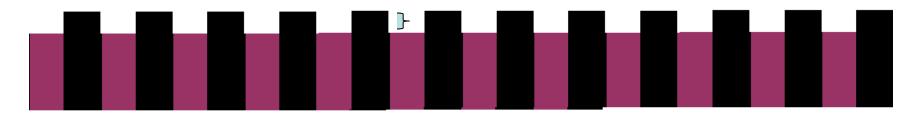

## Energy savings can make your loan payments for you

#### Positive Cash Flow

## Example: project financing with negative cashflow

	F	Project Cashflow

#### Efficiency Vermont's Home Performance with ENERGY STAR® Personalized Cash Flow Report

Multiple financing options and Efficiency Vermont incentives make it possible for the average homeowner to reap the benefits of maximum energy efficiency. Take a look at your Personalized Cash Flow Report below, and see how savings from energy efficiency improvements can offset the cost of your project.

This Report Has Been Prepared For Typical Customer

#### For Your Home At Vermont Single Family Home

(\$3,714)

\$1,318

Project Information	
Total Project Cost (input as negative)	(\$7,600)
Efficiency Vermont Incentive	\$1,560
Customer Down Payment	\$540
Amount to Finance	(\$5,500)

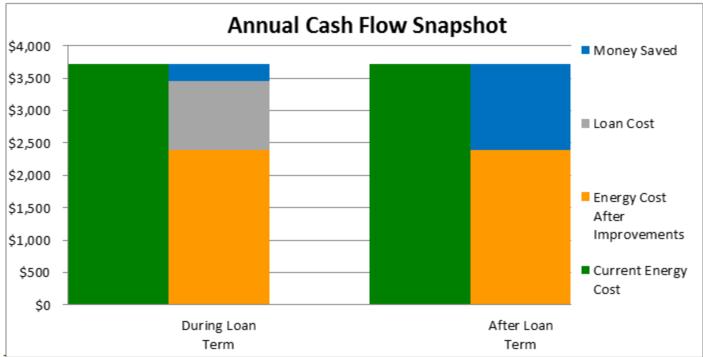

Annual Energy Cost (input as negative) Expected First Year Energy Savings

Loan Information	
Annual Interest Rate	5.0%
Loan Term (months)	72
Monthly Payment	(\$89)
Total Loan Cost	(\$6,378)
Total Interest Paid	(\$878)

Cash Flow Summary - Annually	
Estimated Average Energy Savings	\$1,318
Loan Cost	(\$1,063)
Net Cash Flow During Loan	\$255
Annual Net Cash Flow After Loan	\$1,318
Simple Payback (years)	4.6
<b>Estimated 10 Year Net Cumulative Savings</b> Total saved over 10 years after all loan and improvement costs. Calculated by multiplying the expected first year energy savings by 10 years and subtracting loan and improvement costs (assumes current fuel prices).	\$6,802

## **Residential Project Cashflow**

*This report assumes that current juer prices, occupancy status, and behavior remain unchanged over the course of time. This information does not guarantee the savings you will see, but provides an estimate on what to expect based on current inputs.* 

## Paying for it

- Grants
- Efficiency Incentives
- Budget/Capital Reserves
- Performance Contracting
- Bonding
- Loans
- Tax-Exempt Lease Purchase

## **Combining Non-Energy and Energy Measures**

#### **Mold Remediation**

Total Amount Borrowed Rate and Term Total Cost \$500,000 2.0%, 15 yrs. \$579,158

#### **Energy Efficiency Project - Lighting** Total Amount Borrowed Total Cost Total Energy Savings (15 yrs.)

#### Combined

Total Amount Borrowed Total Net Cost \$45,451 \$52,647 \$152,765

\$545,451 \$479,040

## **Combining Non-Energy and Energy Measures**

\$-Thousands 9 10 11 12 13 14 15 3 5 6 7 8 \$(100) \$(200) \$(300) \$(400) \$(500) \$(600) \$(700) Year Mold Remediation Only Combined with EE

## Leasing

- Leases affect operating expenses (income statement), not capital expenditures (balance sheet)
- Net positive cash flow reduces the risk perceived by lessor
- No penalty for early payoff

## Tax-Exempt Leasing

- "Termination for non-appropriation" if lessee is unable to obtain funding for future payments, lessee can terminate the lease agreement without further obligation or penalty. This is an important provision for public entities that receive funding for one year at a time
- Interest income on a tax-exempt lease is generally not taxable for the lessor, so the cost can be lower
- Good overview and FAQ here: <u>www.aglf.org/faq</u>

- Modern, 3-story, 105K sq. ft., 500 K-8 students
- Inefficient lighting identified by SEMP
- Team formed: Facility Manager, Efficiency Vermont, Supplier, Contractor
- Team put together project scope, estimates for costs & savings. Efficiency VT calculated an incentive.
- Project presented to Tom Petit. Too big for budget, too small for bond. A tax-exempt lease allowed LTS to proceed with no upfront costs
- Project completed early 2011

## Lyndon Town School

**Project Economics** 

- Estimated Net Project Costs (after incentive): \$70,800
- Estimated Annual Project Savings (estimates): \$18,000 annually
- Estimated Rate of Return on Investment (pretax): 25%
- Simple Payback: 3.9 Years
- **Project Financing**
- Tax-exempt lease obtained through Municipal Leasing Consultants
- 4 years, semi-annual payments, low interest rate
- Lease payments are paid from utility savings each year (savings exceeds lease payments)

## Overview of Vermont Energy Efficiency Loan Guarantee Program

## Why did Vermont win a Department of Energy grant?

The proposal addressed many DOE priorities:

- Public/private partnership
- Replicable and scalable
- Use of loan loss reserve as catalyst for private funding
- Existing infrastructure Efficiency Vermont

## Vermont Energy Efficiency Loan Guarantee Program

- Created by Act 87, enacted in June 2013
- Supported by DOE funds, in addition to VEDA
- Designed to encourage private capital for energy efficiency projects
- Any Vermont business or non-profit can borrow
- Can be used for electrical or fossil fuel energy saving projects

## **VEELGP Program Characteristics**

- Loans made by individual banks or credit unions
- VEDA guarantees 75% of the loan, up to \$250,000
- Fee of 3% of the loan guarantee amount may be included in the loan
- Loan term and interest rate should reflect VEDA guarantee
- Underwriting will 'consider value of energy savings'

## Master Guaranty Agreement

"Each loan shall have been made for a project previously analyzed by EVT, and Lender utilized the financial benefits projected by EVT (including projected energy savings and direct cash incentives) to be derived from the energy efficiency elements of the project during the underwriting process of determining borrower qualification."

### Key issues: Energy efficiency financing

- financing is the *last* piece of the puzzle.
- longer-term financing -
  - better aligns the period of payment with the period of the savings (life of measures).
  - could allow most or all of the required investment to be paid for out of savings.

## Recommendations for thinking about energy efficiency financing

- It's an investment, not an expense.
- Understand the opportunity cost. Doing nothing might be the most expensive option!
- Show exactly where the savings are coming from, using conservative estimates. Efficiency Vermont can help you with this.
- Total cost is frequently less important than positive cash flow.
